(speak to Sara)

This branch of the Echo Group of companies opened in 2006 - coming up to 20 years and still going strong. This branch offers all the same products as the other branches: Prestress in Gauteng and Topfloor in the Western Cape.

KZN has many hills and valleys so the access for our equipment can be challenging. Therefore, even before you start building you should consult with Echo, who will determine the best way to install our slabs and walls. Which will be more economical than trying to squeeze a crane into places that a crane can't go.

Remember that precast is the quickest method to do the concrete decking, without the need for propping. There are 5 depths of slabs available: 120, 150, 170, 200 and 250 mm. The steel used in the slabs are 5 mm triple indented wire and 9.3 mm and 12.5 mm strands. The configuration of steel is determined by the designers. The slab depth and the superimposed loads will determine what we call wiring patterns.
