# STAIRS & OPENINGS

Part 1

Creating openings for stairs, elevators and other architectural elements requires meticulous planning and execution. At Echo, our team of experienced engineers designs the layout of openings, ensuring that the structural integrity of the slab is maintained.

The steel beams are fabricated to the exact specifications required for the project. This includes cutting, welding and assembling the beams to create the desired openings.

The longevity and durability of steel beams reduce maintenance costs, offering long-term savings.

These beams can be used in various applications, including staircases, balconies and other architectural features.
